# Goals

- Characterization of resistance to *Dickeya solani* in diploid interspecific hybrids of *Solanum*.
- Are progeny tubers of the most tolerant diploids, grown from vacuum infiltrated seed tubers with *D. solani*, infected?

# Testing tuber resistance to *D. solani*

- *Dickeya solani* – IBF0099 (syn. IPO2276) (Golanowska *et al.* 2015)
- Bacterial suspension –  $10^8$  CFU/ml
- 10 µl inoculum (hole size - 10mm x 2mm)

(Laurila *et al.* 2008; Lebecka, 2001)

# Testing tuber resistance to *D. solani*

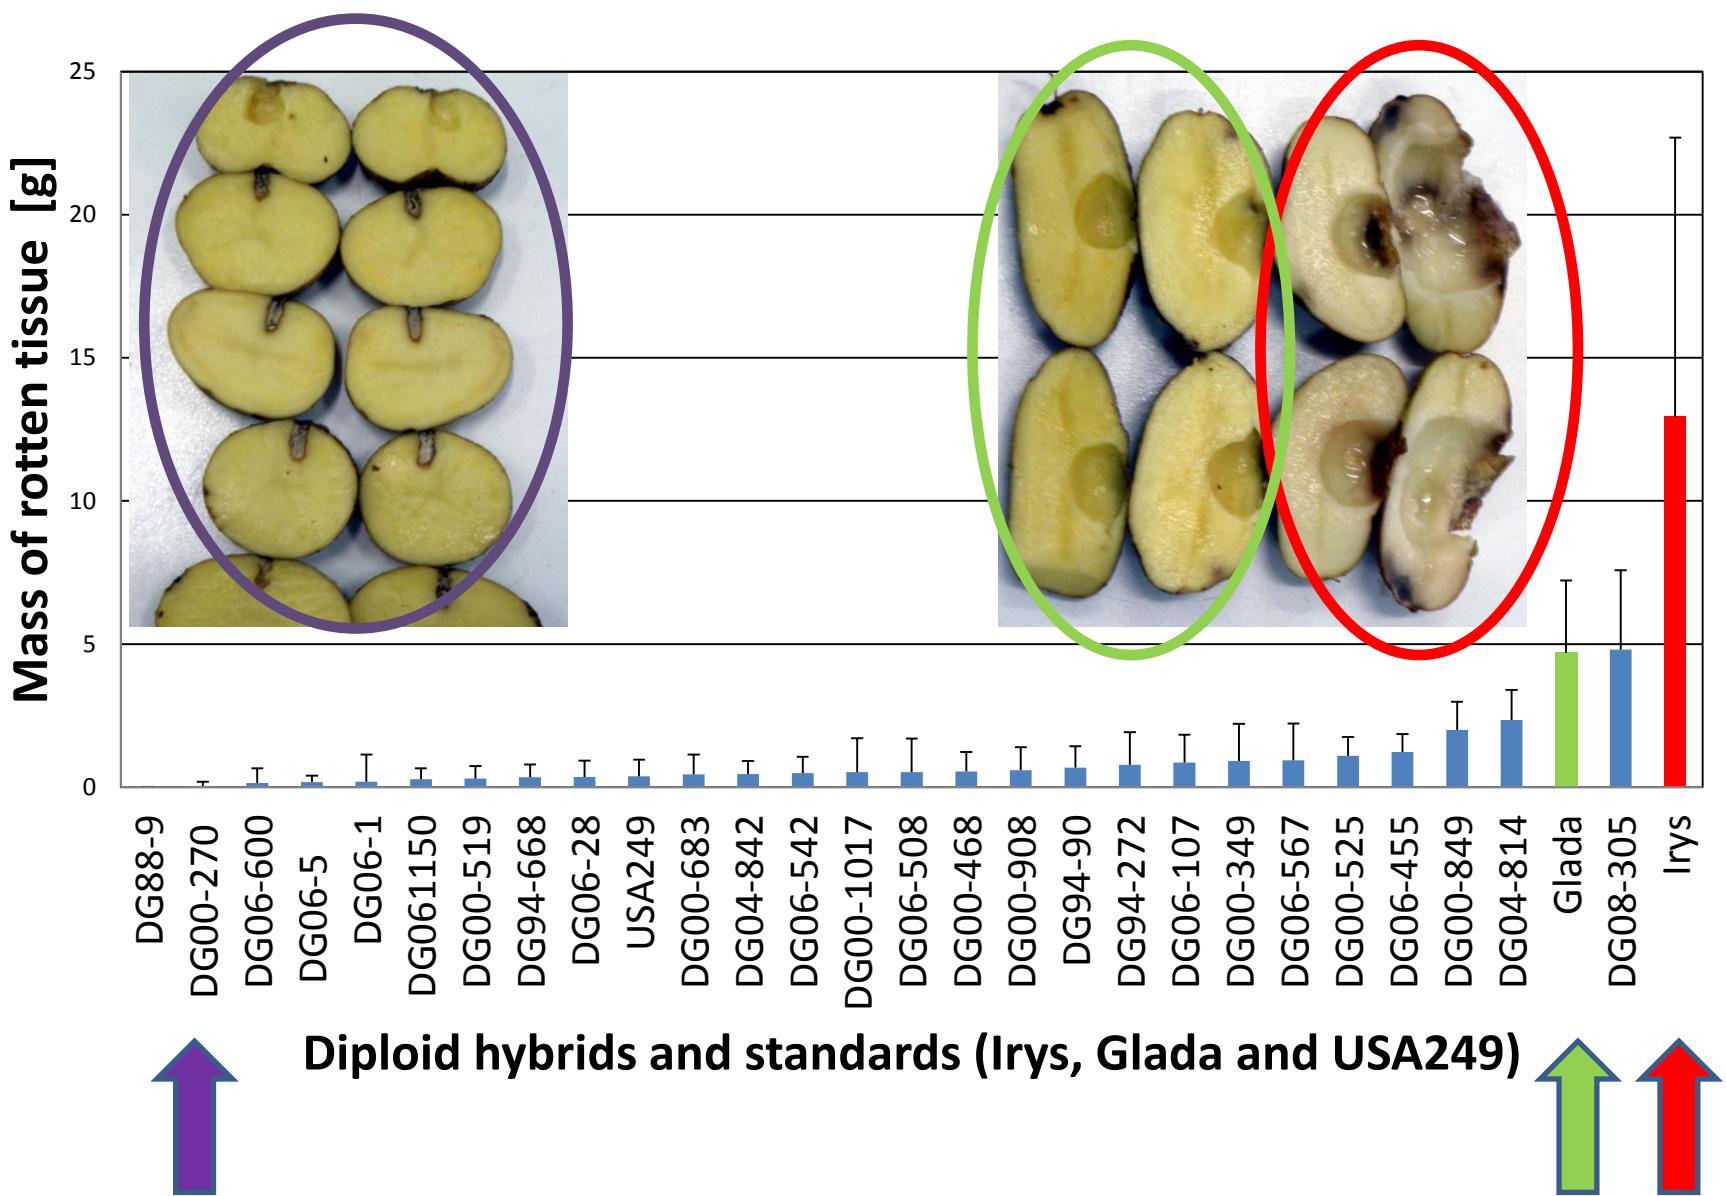

- 26 (2x) hybrids of *Solanum*
- check cultivars: Irys and Glada

3 dates x 5 tubers x 2 replications

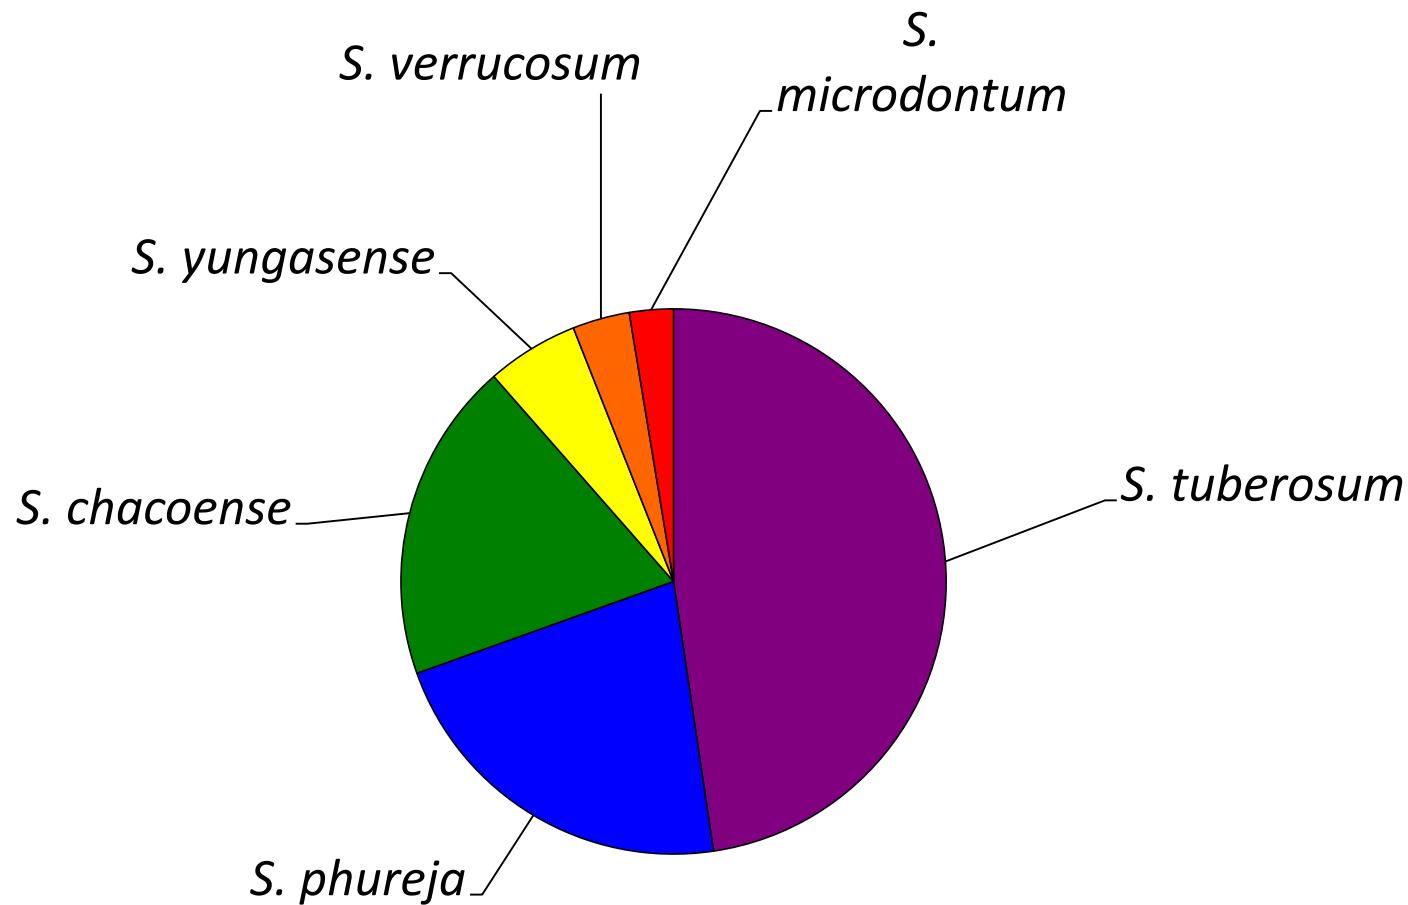

3 - 4 days, temperature 26 °C

# Testing tuber resistance to *D. solani*

# The *Solanum* hybrid (2x)

DG 00-270

# Testing plant resistance to *D. solani*

## Inoculation of the base of the potato stem

- 26 (2x) hybrids of *Solanum*
- 7 cultivars
- 2 check cultivars: Irys and Glada
- 26 - 80 plants/ genotype

(the method acc. to Pietrak, 2001)

# Testing plant resistance to *D. solani*

*D. solani* -  $10^8$  CFU/ml

# Testing plant resistance to *D. solani*

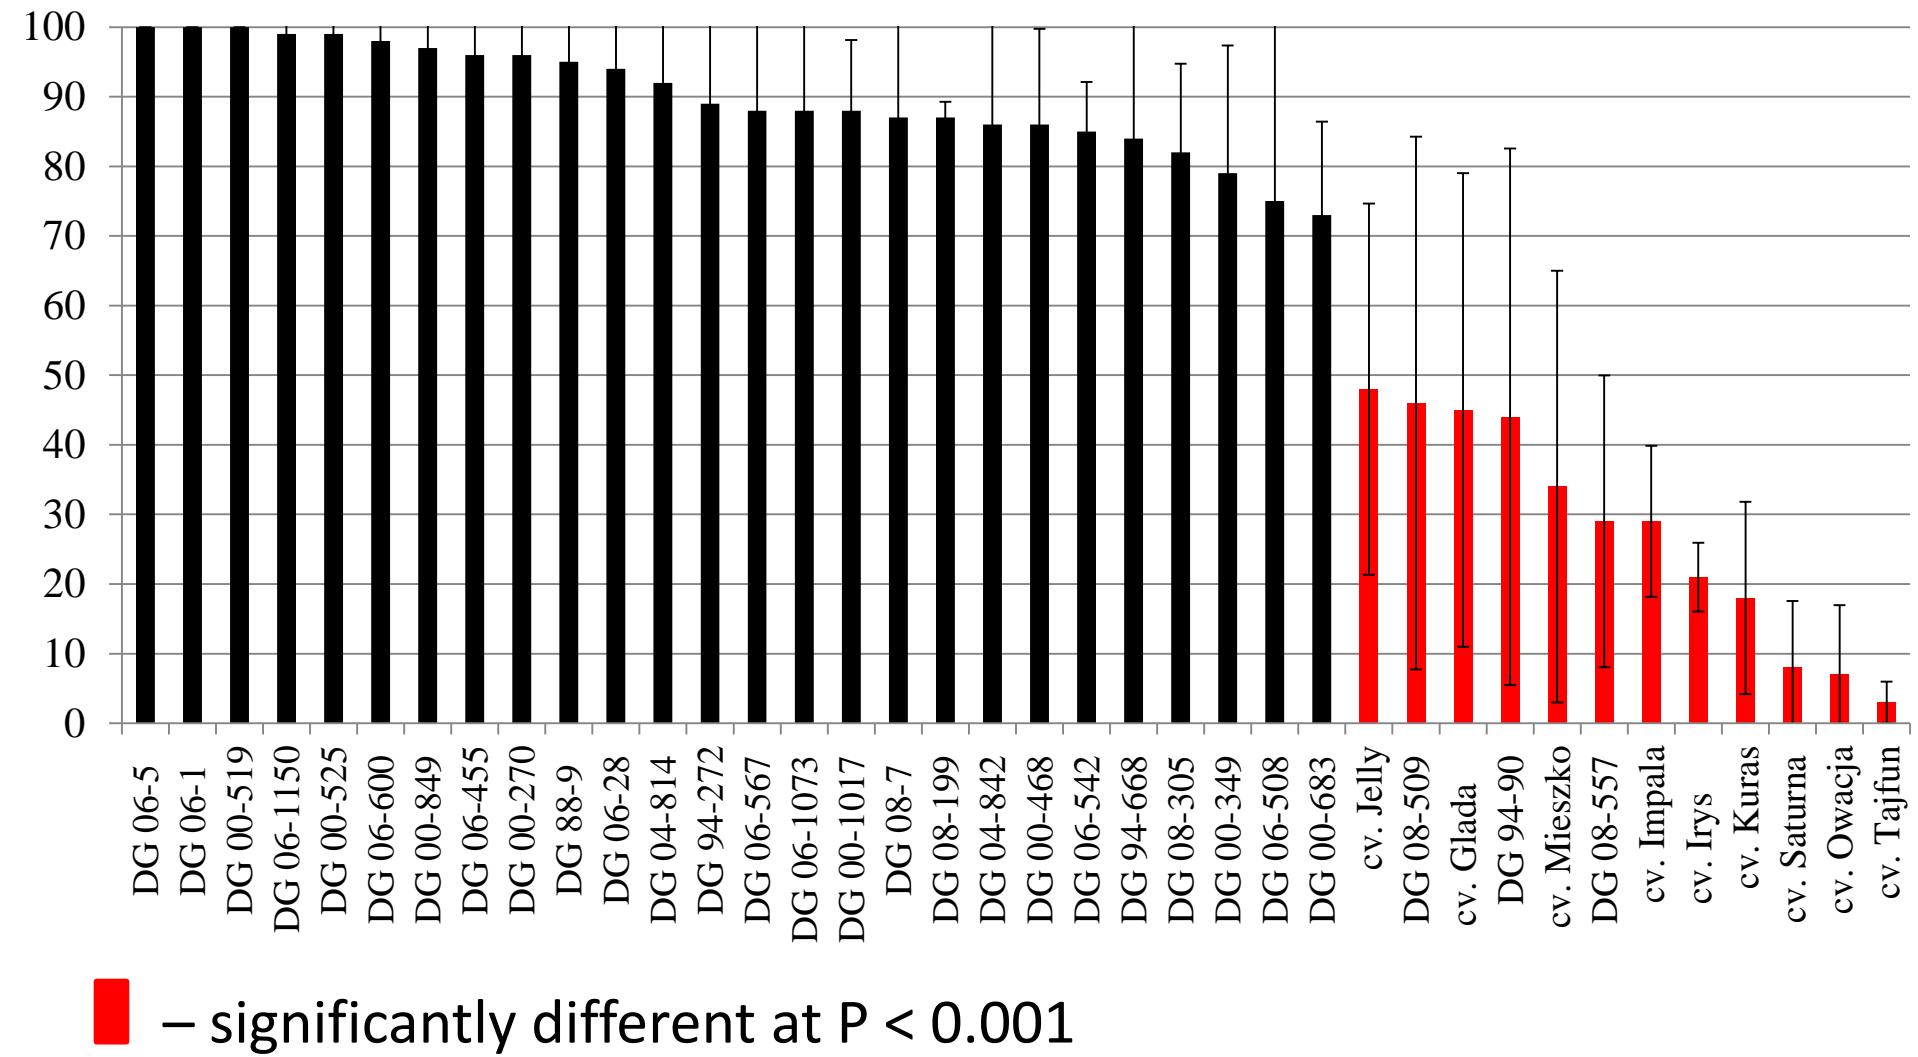

1<sup>st</sup> date – blackleg symptoms in **three days** post inoculation

# Testing plant resistance to *D. solani*

2<sup>nd</sup> date – wilting, necroses -**10 days** post inoculation

# Plants without symptoms of infection (%)

# Testing plant resistance to *D. solani*

## Inoculation of seed tubers

- Cultivars: Irys, Kondor
- $10^8$  and  $10^7$  CFU/ml
- Sprouted tubers 17 h in water before inoculation,  
0.1 Mpa for 20 min, allowed to dry for 2 hours
- planted in pots
- DNA extracted 2 weeks post inoculation

(the method acc. to Helias *et al.* 2000)

# Detection of *D. solani* by real time PCR

## Primers:

SOL-C - Pritchard *et al.* (2012),

ds - Van Vaerenbergh *et al.* (2012).

Bacterial DNA: 2,48 ng/ $\mu$ l (1 $\mu$ l/reaction)

DNA from plant samples: 5 ng/  $\mu$ l

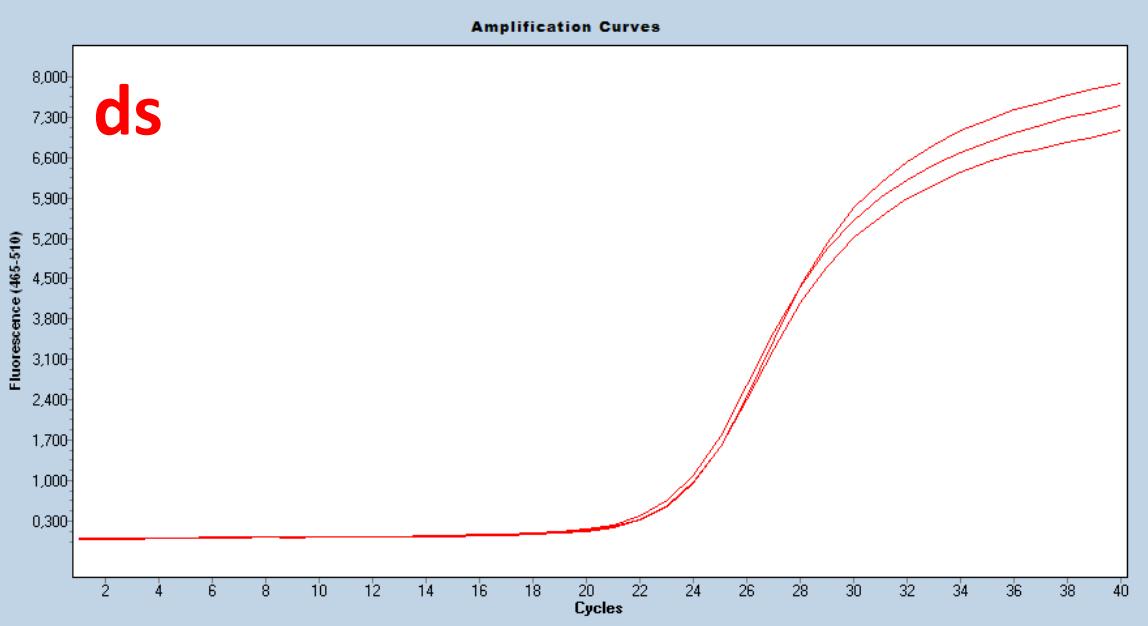

Negative control DNA from healthy plant King Edward

Reference gene:  $\beta$ -tubulin

# Detection of *D. solani* by real time PCR

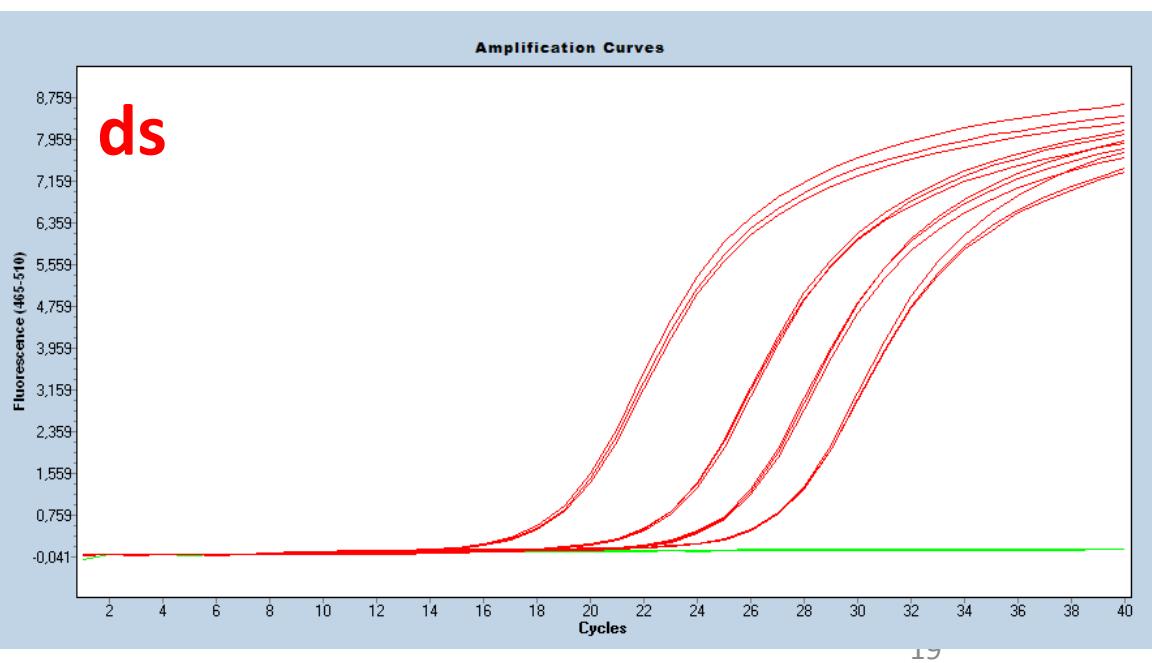

Inoculation method	Origin of DNA	Bacteria	Crossing point value (Cp) relative expression ( $2^{-\Delta Cq}$ ) of target sequence to the reference gene Tub

# Summary

- Diploid interspecific hybrids of potato exhibit higher resistance to tuber soft rot and higher resistance/tolerance of plants to infection with *D. solani* than 4x potato cultivars.
- The progeny tubers of the most tolerant diploids, grown from vacuum infiltrated seed tubers, will be tested for latent infection with *D. solani*.

THANK YOU
